

## Transferring Digital Video to iMovie

1. Connect the 4 to 6 pin Firewire cable from the front of the digital video camera to the Firewire port on the Mac
2. Turn the camera power switch to the **play position**.
3. On the Mac, open iMovie - the icon is in the bottom middle of the screen.

4. After iMovie opens, select **File->New Project**.

5. **VERY IMPORTANT – Name your project.** In left column of the new window, select **Desktop** and type a name for your project, **using the following format: "jsmithCivilRights"**

(The first initial of your first name, followed by your last name & then follow with the topic)

6. Move the slider near the bottom-left from the scissors to the camera position. The display should turn blue and display the words "Camera Connected."

7. Make sure the camera is on and set to the spot where you want to begin importing your video. Select the **Import** button. The video should begin importing. When you are finished importing, press the **Import** button again to stop importing.

☺ **Now you are ready to begin editing your movie project.**
